

## TENT WITH EXTENDABLE WINDOWS

This application claims priority from U.S. Provisional Applications Serial No. 60/272,385 filed 2/28/2001, which has the same inventor as the present  
5 application.

### TECHNICAL FIELD

The present invention relates generally to portable living structures and  
10 specifically to tents.

### BACKGROUND ART

Tents have been used for centuries as temporary structures for camping trips.  
15 During these trips, there may be competing desires for comfort on one hand, while a camper may still desire to get away from the complications of city life. The use of lightweight materials has made the satisfaction of these competing desires more easily accomplished. Tent fabrics, as well as tent poles and frame structures, can now be made to be very strong, while also very lightweight. This use of materials  
20 allows more imaginative and varied structures to be designed, which are still light enough to be easily portable, and thus practical for camping trips.

Another pair of competing needs facing campers and users of tents is that of the need for a reasonably small floor space, while providing enough internal volume for comfort. When camping in the woods, the extent of usable flat ground  
25 area may be limited, by trees or uneven terrain, thus a tent which has a large “footprint” or floor area will find fewer useable sites than one that has a smaller footprint. At the same time, a user will generally feel a need for “elbow room” and

may feel cramped without a reasonable amount of space.

Thus there is a need for a tent which has a compact footprint, but which has an interior volume which is greater than that of a tent having the traditional inwardly tapering, or even strictly vertical walls.

Summary  
~~DISCLOSURE OF INVENTION~~

Accordingly, it is an object of the present invention to provide a tent which has a compact footprint.

Another object of the invention is to provide a tent which has an enlarged internal enclosed volume.

And another object of the invention is to provide windows which are protected from rain entry.

A further object of the present invention is to provide windows which are extended from the main body of the tent, and thus enlarge the interior volume.

Briefly, one preferred embodiment of the present invention is a tent with extendable windows having a main structure including a plurality of walls which are oriented at a first angle with respect to a vertical reference. The tent also includes at least one window which is extendable to a second angle with respect to a vertical reference, where the second angle is a more negative angle than the first angle thus producing windows which are extendable horizontally further than the tent walls.

An advantage of the present invention is that it provides extendable windows which extend from the main volume of the tent, and thus enlarge it.

Another advantage of the present invention is that the extendable windows can be retracted against the tent sides if necessary.

And another advantage of the present invention is that the extendable windows have a water-proof awning portion, and the screen area of each window slopes negatively back towards the main tent structure, thus preventing rain from entering.

A further advantage of the present invention is that the extendable windows provide an enlarged volume area at or around a typical adults' head, shoulder and torso area, thus providing enlarged volume in the area where more adults are largest, rather than down by their feet.

A yet further advantage is that the enlarged volume provides a psychological feeling of being less cramped to some people, which may be out of proportion to the actual increase in volume achieved.

These and other objects and advantages of the present invention will become clear to those skilled in the art in view of the description of the best presently known mode of carrying out the invention and the industrial applicability of the preferred embodiment as described herein and as illustrated in the several figures of the drawings.

## BRIEF DESCRIPTION OF THE DRAWINGS

The purposes and advantages of the present invention will be apparent from the following detailed description in conjunction with the appended drawings in which:

FIG. 1 shows an isometric front view of a tent with extendable windows having an open screen roof.

FIG. 2 illustrates a front plan view of a tent with extendable windows;  
FIG. 3 shows a side plan view of a tent with extendable windows; and  
FIG. 4 illustrates an isometric view of a tent with extendable windows  
having a soffited roof.

5  
Detailed Description

~~BEST MODE FOR CARRYING OUT THE INVENTION~~

10 A preferred embodiment of the present invention is a tent with extendable windows. As illustrated in the various drawings herein, and particularly in the view of FIG. 1, a form of this preferred embodiment of the inventive device is depicted by the general reference character **10**.

15 FIG. 1 illustrates an isometric view of a tent with extendable windows **10**. The configuration of the actual tent main structure **12** may have many different forms and variations for which the extendable windows **14** of the present invention are suitable. The tent will generally include a front wall **16**, a rear wall **18**, side walls **20**, a floor **22** and a roof or ceiling **24**. In this figure, the roof **24** is open except for a screen **26**, whereas in Fig. 4, below, the roof is a soffited roof **28** with an overhanging portion **30**.

20 In Figs. 1 and 3, there are shown to be two extendable windows **14**, which are on either side wall **20** of the tent **10**. This is of course one variation among many, as the rear wall **18** may, in other designs, include a extendable window, for a total of three, or there may be only one extendable window **14**, or there may multiple smaller extendable windows along one side wall **20**, in tents which have  
25 longer side walls **20** compared to the width of the front wall **16** shown here.

Referring now also to Figs. 2-4, the extendable window **14** includes an upper panel or awning **32**, which is preferably water-proof or water resistant, and joined

at a rear seam 34 to the main body of the tent 12. The extendable window 14 also preferably includes a frame 36, which in turn is preferably made up of several segments 38 which link together to form a bow-shaped member, roughly parabolic in shape, although this shape is not a requirement. The segments 38 may be completely detachable from each other, or they may be joined by an internal elastic cord 40 (not visible), which keeps the segments 38 together in proper order, but still allows the frame 36 to be folded for easy storage.

As seen especially in Figs. 1 and 2, the extendable window 14 includes a cloth or fabric sleeve 42 into which the frame 36 fits. There are preferably openings 44 in the sleeve 42 through which the end of the frame 36 may be inserted. These opening 44 may be at various locations in the sleeve 42 and are not limited to the location shown.

The extendable window 14 also includes a screen portion 46, which is used to keep out insects, etc., and may include window flaps 48 or curtains, (not visible), which can be zipped together to keep out wind, light and to ensure privacy. These window flaps 48 may be internal or external to the tent main body 12, but are preferred to be internal.

The extendable window 14 also includes a bat wing panel 50 located at or near the leading edge 52 of the extendable window 14. This bat wing panel 50 acts as an attachment site for a guy rope or wire 54. The guy wire 54 is attached to a stake 56 (not shown) or branch or other anchoring object, and serves to keep the extendable window 14 expanded to its full extent. The extendable window 14 has a hinge portion 59, in a manner of speaking, at its lower attachment seam 58, as the fabric to which the sleeve 42 ends are fastened, allow the frame 36 to pivot forward when the extendable window 14 is extended, as when tensioned by the guy wire 54. The extendable window 14 is however retractable to some extent, as for instance, when the camp site space is limited, and the extendable windows 14

21/5/2014 10:08:54 AM  
would otherwise project into bushes or tree branches. In these cases, the frames 36 may be pivoted back towards the side walls 20 and perhaps fastened in place by Velcro® loops, etc.

The side walls 20 shown in the figures slope inward in a conventional manner so that the floor area 22 is larger than the ceiling area 24. Thus a window which is co-planar with the walls 20 (which are generally at some positive angle  $\alpha$  60 with respect to a vertical line), would be expected to receive some run-off during rain storms, or some amount of the rain falling vertically in that area. However, the tent with extendable windows 10 has the advantage that the extendable windows 14 extend out past vertical to present a negatively sloped angle  $\beta$  62 to the screen 46, as can be seen in Fig. 2. The water-proof or water resistant awning 32 protects the window 14 from rain intrusion which falls vertically, and even prevents some component of wind-blown rain traveling at less than the negative angle  $\beta$  62. The window may also be at a positive angle  $\beta$  62, which is less positive (and thus more negative) than angle  $\alpha$  60 of the walls 20. Thus, when the angle of the windows is spoken of as more negative than the slope of the walls, it includes cases where the angle  $\beta$  is negative, where angle  $\beta$  is positive but less positive than the angle  $\alpha$ , or when the angle  $\beta$  is vertical and angle  $\alpha$  is positive. For purposes of this discussion, a positive angle is considered to extend in a counter-clockwise direction from a vertical reference, and a negative angle is assumed to extend in a clockwise direction.

The frame 36 gives a defined shape to the extendable window 14, but it is also possible to have a variation without a rigid frame, or perhaps no frame at all if additional guy wires or ropes are attached to the leading edge 52.

An advantage of the present invention 10 is that it provides additional space near the region of the average adult's head and shoulders, a space which is

typically constricted by the inward sloping of the walls. Most humans are wider near the shoulder area or torso area, rather than at foot or knee-height.

Additionally, most humans form their perception of being “cramped” or “crowded” from visual cues received from head height. By adding volume near the shoulder and head area, without effecting the floor area, the tent may be perceived as being much more comfortable and roomy, while still maintaining a compact “footprint” or floor area. The compact footprint will generally enable the user a larger selection of usable camp sites than one with a larger footprint.

While various embodiments have been described above, it should be understood that they have been presented by way of example only, and not limitation. Thus, the breadth and scope of a preferred embodiment should not be limited by any of the above described exemplary embodiments, but should be defined only in accordance with the following claims and their equivalents.

#### INDUSTRIAL APPLICABILITY

The present tent with extendable windows **10** is well suited for application in the home, backyard, or on camping trips and picnics.

The tent will generally include a front wall **16**, a rear wall **18**, side walls **20**, a floor **22** and a roof or ceiling **24**. One or more extendable windows **14** are included on either side wall **20** of the tent **10**. The extendable windows **14** each include an upper panel or awning **32**, which is preferably water-proof or water resistant, and joined at a rear seam **34** to the main body of the tent **12**. The extendable window **14** also preferably includes a frame **36**, which in turn is

preferably made up of several segments **38** which link together to form a bow-shaped member, preferably roughly parabolic in shape. The segments **38** may be completely detachable from each other, or they may be joined by an internal elastic cord **40**, which keeps the segments **38** together in proper order, but still allows the frame **36** to be folded for easy storage.

The side walls **20** generally slope inward in a conventional manner so that the floor area **22** is larger than the ceiling area **24**. The extendable windows **14** preferably extend out past vertical to present a negatively sloped angle  $\beta$  **62** to the screen **46**. The water-proof or water resistant awning **32** protects the window **14** from rain intrusion which falls vertically, and even prevents some component of wind-blown rain traveling at less than the negative angle  $\beta$  **62**. The window may also be at a positive angle  $\beta$  **62**, which is less positive (and thus more negative) than angle  $\alpha$  **60** of the walls **20**. The frame **36** gives a defined shape to the extendable window **14**, but it is also possible to have a variation without a rigid frame, or perhaps no frame at all if additional guy wires or ropes are attached to the leading edge **52**.

The present invention **10** provides additional space near the region of the average adult's head and shoulders, a space which is typically constricted by the inward sloping of the walls. Most humans are wider near the shoulder area or torso area, rather than at foot or knee-height. Additionally, most humans form their perception of being "cramped" or "crowded" from visual cues received from head height. By adding volume near the shoulder and head area, without effecting the floor area, the tent may be perceived as being much more comfortable and roomy, while still maintaining a compact "footprint" or floor area. The compact footprint will generally enable the user a larger selection of usable camp sites than one with a larger footprint. Thus, the tent **10** is useful in many camping situations and is

expected to be popular with users.

For the above, and other, reasons, it is expected that the collapsible chair with resilient support elements **10** of the present invention will have widespread industrial applicability. Therefore, it is expected that the commercial utility of the present invention will be extensive and long lasting.
